

# **Computer Vision p1**

2-08-2026

Hebah Omer Soleman

# Table of Contents

---

1. Introduction.
2. Applications of Computer Vision.
3. Image Representation.
4. Convolutional Neural Network (CNN) and its Components.
5. CNN-based Architectures (AlexNet, VGG, InceptionNet, ResNet, EfficientNet, and MobileNet).

# Learning Outcomes

---

- Understand the basic concepts of Computer Vision and its real-world applications.
- Describe how images are represented and processed in a computer.
- Explain the fundamental building blocks of Convolutional Neural Networks (CNNs).
- Differentiate between popular CNN architectures (AlexNet, VGG, InceptionNet, ResNet, EfficientNet, and MobileNet) and their key innovations.

# Computer Vision

---

Building artificial systems that process, perceive, and reason about visual data

# How to represent an image?

---

- RGB images have 3 channels.

# How can we build vision models?

---

- So far, we've worked with tabular data, where each sample consists of structured features. We processed this data using Fully Connected Neural Networks.

- But can we apply the same approach to images?

# How can we build vision models?

---

- Let's try.

# How can we build vision models?

- Let's consider each pixel as a feature.

- This should work! But...

# Drawbacks of Fully-Connected Neural Networks

- The number of trainable parameters becomes extremely large

# Drawbacks of Fully-Connected Neural Networks (cont.)

- Little or no invariance to shifting, scaling, and other forms of distortion
- In other words, the Fully connected NN cannot recognize that the two images (original and shifted) represent the same object

Figure "lanigirO :2A "character.

Figure "detfihS :3A "character.

# Drawbacks of Fully-Connected Neural Networks (cont.)

- The topology of the input data is completely ignored (it treats pixels as independent features rather than structured patterns.)
- For a  $32 \times 32$  image, we have
  - Black and white patterns:  $2^{1024} = 2^{32} * 2^{32}$
  - Grayscale patterns:  $256^{1024} = 256^{32} * 256^{32}$

# What do we need?

---

- We need a model that can:
  - **Find Patterns in Images** dna segde ekil serutaef llams ezingoceR :  
shapes in different parts of the image.
  - **Work Efficiently** gnisucof yb yletarapes lexip yreve ta gnikool dioVA : on  
groups of pixels together.
  - **Handle Changes** ,sevom ti fi neve tcejbo emas eht ezingocer lliT :  
rotates, or looks slightly different.

# What do we need?

Figure krowteN larueN lanoitulovnoC :4

# Convolutional Neural Networks (CNNs)

---

- The feature extractor consists of three essential components:
  - **Convolution Layers** ,serutxet ,segde sa hcus snrettap lacol tceteD :  
and shapes by applying filters to the image.
  - **Activation Function (ReLU)**.ytiraenil-non sddA :
  - **Pooling Layers**.serutaef detcartxe fo ezis laitaps eht ecudeR :
- Let's start with the convolution layer.

# How Convolution Works?

---

- Let's consider this image.

# How Convolution Works? (cont.)

---

- .1The image is divided into small overlapping tiles (regions).

# How Convolution Works? (cont.)

---

.2We process each tile using the weights matrix of a small neural network. We call this matrix a **kernel** or **filter**.

## Processing a single tile

# How Convolution Works? (cont.)

---

.3 Finally, the filter slides across the image (with the same weights) and processes all the tiles, creating an output **feature map**.

# How Convolution Works? (cont.)

---

- What we did in the last step is called the **Convolution Operation**.
- We convolved the kernel with the image, which means sliding the kernel over the entire image and computing the dot product between the kernel and small regions of the image at each step.

# How Convolution Works? (cont.)

---

- This can be represented mathematically by:

$$z_{i,j} = \sum_{a=0}^{m-1} \sum_{b=0}^{n-1} W_{a,b} X_{i+a, j+b}$$

- $z_{i,j}$  is the output at position  $(i, j)$ .
- $W_{a,b}$  is the weight at position  $(a, b)$ .
- $X_{i+a, j+b}$  is the input at position  $(i+a, j+b)$ .
- $m$  and  $n$  are the dimensions of the weight matrix  $W$ .
- $i$  and  $j$  are the dimensions of the input  $X$ .

# How Convolution Works? (cont.)

---

The **kernel** slides across the image and produces an output value at each position

# How Convolution Works? (cont.)

---

The **kernel** slides across the image and produces an output value at each position

# How Convolution Works? (cont.)

---

The **kernel** slides across the image and produces an output value at each position

# How Convolution Works? (cont.)

- **Receptive Field** lenrek eht taht egami tupni eht fo noiger ehT : operates on at each step.
- **Feature Map** egami tupni eht morf detcartxe serutaef ehT :

# How Convolution Works? (cont.)

---

We convolve multiple kernels and obtain multiple feature maps or **channels**

# How Convolution Works? (cont.)

- **Filters Example**, segde ekil snrettap tceted sretlif tnereffiD : textures, or smoothness, producing corresponding feature maps.

$$\begin{bmatrix} 1 & 0 & -1 \\ 0 & 0 & 0 \\ -1 & 0 & 1 \end{bmatrix}$$

$$\begin{bmatrix} 0 & 1 & 0 \\ 1 & -4 & 1 \\ 0 & 1 & 0 \end{bmatrix}$$

$$\begin{bmatrix} -1 & -1 & -1 \\ -1 & 8 & -1 \\ -1 & -1 & -1 \end{bmatrix}$$

$$\begin{bmatrix} 0 & -1 & 0 \\ -1 & 5 & -1 \\ 0 & -1 & 0 \end{bmatrix}$$

$$\frac{1}{16} \begin{bmatrix} 1 & 2 & 1 \\ 2 & 4 & 2 \\ 1 & 2 & 1 \end{bmatrix}$$

# Controlling the Convolution Process

---

- Applying Convolution as such reduces the size of the borders.
- Sometimes this is not desirable.

# Controlling the Convolution Process (cont.)

- Solution: We can use **Padding**.
  - it has two types:
    1. **Same Convolution**
- .ezis tupni

# Controlling the Convolution Process (cont.)

- ▶ **1. Full Convolution** eritne eht srevo lenrek eht os dedda si gniddaP :  
.segde gnidulcni ,tupni
- ▶
  - $\text{output size} = \text{input size} + \text{kernel size} - 1$

# Controlling the Convolution Process (cont.)

- **Strided Convolution**1 < pets a htiw egami eht gnola sedils lenreK :
- Larger strides reduce output size.

# Controlling the Convolution Process (cont.)

- **Strided Convolution**1 < pets a htiw egami eht gnola sedils lenreK :
- Larger strides reduce output size.

- **Pooling** resolution and extract more general features.

# Controlling the Convolution Process (cont.)

---

# Controlling the Convolution Process (cont.)

- **Dilated Convolution**  $\times$  between kernel elements.
- It expands the receptive field without increasing the number of parameters, which makes it efficient.

# CNN Output size

---

$$n_{out} = \frac{n_{in} - k + 1}{s}$$

$n_{in}$  : input size  
 $n_{out}$  : output size  
 $k$  : kernel size  
 $p$  : padding  
 $s$  : stride

# Activation

---

- Just like Fully-Connected Neural Networks, we can apply an activation over convolutional layer outputs
- It helps break linearity
- For example, Rectified Linear Unit (ReLU):  $\sigma x = (\max(x, 0))$

**Feature Map**

$$\hat{x}_{i,j} = \frac{x_{i,j} - \mu_j}{\sqrt{\sigma_j^2 + \epsilon}}$$

# Most Notable CNN-based Architectures

---

- Over time, researchers built advanced CNN architectures to improve performance and efficiency. These architectures introduced key innovations:
  - **AlexNet [Krizhevsky et al., 2012]**  
breakthrough performance on image classification.
  - **VGGNet [Simonyan and Zisserman, 2014]**  
networks (up to 19 layers).
  - **InceptionNet (GoogLeNet) [Szegedy et al., 2014]**  
filter sizes per layer (Inception modules).
  - **ResNet [He et al., 2015]**  
very deep networks.
  - **EfficientNet [Tan and Le, 2019]**  
simultaneously scales a CNN's depth, width, and resolution optimally using a single scaling coefficient.

# AlexNet

- First big improvement in image classification.
- Made use of CNN, pooling, dropout, ReLU and training on GPUs.
- 5convolutional layers, followed by max-pooling layers; with three fully connected layers at the end

# VGGNet

- **Improvement over AlexNet:** Uses a deeper network with small filters instead of a shallow network with larger filters.
- A stack of 3x3 conv layers (vs. 11x11 conv) has same receptive field, more non-linearities, fewer parameters and deeper network representation.
- Two variants: VGG16 or VGG19 conv layers plus 3 FC layers

# InceptionNet

---

- Going Deep: 22 layers
- Only 5 million parameters! (  $\text{rewe} \times 27$  ,teNxeIA naht rewe  $\times 12$  than VGGNet).
- Introduced efficient "Inception module"
- Introduced "bottleneck" layers that use  $1 \times 1$  convolutions to reduce the number of channels and mix information across them.

# InceptionNet (cont.)

- **Inception module:** Uses multiple filter sizes (  $n_i$ ,  $5 \times 5$ ,  $3 \times 3$ ,  $1 \times 1$  parallel, to capture different features, then combines their

# ResNet: Motivation

---

- **Problem:** Making networks deeper does not always improve accuracy.
- **Why?** In very deep networks, gradients become extremely small as they move backward through layers, making learning slow or stopping it altogether (**vanishing gradient problem**).
- **Solution:** Residual Network (ResNet) introduces **skip connections** .ylisae erom wolf ot noitamrofni gniwolla ,(slaudiser)

# ResNet

---

- Very deep networks using residual connections
- -152layer model for ImageNet
- Stacked Residual Blocks
- **Residual:** A shortcut connection that helps the network pass information through layers more easily.

# ResNet

---

- What happens when we continue stacking deeper layers on a “plain ” convolutional neural network?

# ResNet

---

- What happens when we continue stacking deeper layers on a “plain” convolutional neural network?

# ResNet

---

- What happens when we continue stacking deeper layers on a “plain” convolutional neural network?

- -56layer model performs worse on both test and training error

# ResNet

---

- What happens when we continue stacking deeper layers on a “plain” convolutional neural network?

- 56layer model performs worse on both test and training error
- The deeper model performs worse, but it's not caused by overfitting!

# ResNet

---

- **Fact:** Deep models have more representation power (more parameters) than shallower models.

# ResNet

---

- **Fact:** Deep models have more representation power (more parameters) than shallower models.
- **Hypothesis:** The problem is an optimization problem, deeper models are harder to optimize

# ResNet

---

- **Fact:** Deep models have more representation power (more parameters) than shallower models.
- **Hypothesis:** The problem is an optimization problem, deeper models are harder to optimize
- **Solution:** Use network layers to fit a residual mapping instead of directly trying to fit a desired underlying mapping

# ResNet

---

- **Fact:** Deep models have more representation power (more parameters) than shallower models.
- **Hypothesis:** The problem is an optimization problem, deeper models are harder to optimize
- **Solution:** Use network layers to fit a residual mapping instead of

# ImageNet

---

- The most extensive data for Image Classification
- 3RGB channels from 0 to 255
- 14,197,122 images
- 1000 classes

# ImageNet Large Scale Visual Recognition Challenge (ILSVRC) winners

# EfficientNet: Motivation

---

- **Problem:** To improve accuracy, we can:
  - Increase the number of layers (**depth**)
  - Increase the number of neurons in each layer (**width**)
  - Use higher-resolution images (**resolution**)But finding the right balance of these three was largely based on trial and error.
- **Solution:** EfficientNet introduced a **compound scaling** method—a mathematical formula to systematically find the optimal balance among **depth**, **width** and **resolution**.

# EfficientNet

Figure .gnilacS teNtneiciffE :5

# EfficientNet

---

- **Compound Scaling** Uses a single **scaling coefficient**  $\phi$  to control:
  - **Network Depth**  $\rightarrow (\phi\alpha)$  More layers
  - **Network Width**  $\rightarrow (\phi\beta)$  More channels per layer
  - **Input Resolution**  $\rightarrow (\phi\gamma)$  Larger input images
- The goal: find  $\gamma, \beta, \alpha$  that balance accuracy & efficiency, then scale up optimally by increasing the global coefficient  $\phi$

# EfficientNet

---

- EfficientNet optimizes depth, width, and resolution using this constraint:

$$2 \approx \gamma^2 \cdot \beta \cdot \alpha$$

- Why this equation?**
  - Increasing **depth** sPOLF sesaercni ( $\alpha$ ) **linearly**.
  - Increasing **width** sPOLF sesaercni ( $\beta$ ) **quadratically** .( $^2\beta$ )
  - Increasing **resolution** sPOLF sesaercni ( $\gamma$ ) **quadratically** .( $^2\gamma$ )
- To double total FLOPs, the three factors must be balanced together.

# EfficientNet

---

- The authors of EfficientNet searched for the best scaling factors on a small baseline model.
- They found:  
 $1.2 = \alpha$        $1.1 = \beta$      $1.15 = \gamma$

# EfficientNet Scaling: B0 to B7

- The EfficientNet family (B0 to B7)

Depth =  $\phi 1.2$     Width =  $\phi 1.1$     Resolution =  $\phi 1.15$

| Model | $\phi$ | Depth ( $\phi\alpha$ ) | Width ( $\phi\beta$ ) |
|-------|--------|------------------------|-----------------------|
| B0    | 0      | $1.0 = 1.2^0$          | $1.0 = 1.1^0$         |
| B1    | 1      | $1.2 = 1.2^1$          | $1.1 = 1.1^1$         |
| B2    | 2      | $1.44 = 1.2^2$         | $1.21 = 1.1^2$        |
| B3    | 3      | $1.73 = 1.2^3$         | $1.33 = 1.1^3$        |
| B4    | 4      | $2.07 = 1.2^4$         | $1.46 = 1.1^4$        |
| B5    | 5      | $2.49 = 1.2^5$         | $1.61 = 1.1^5$        |
| B6    | 6      | $2.99 = 1.2^6$         | $1.77 = 1.1^6$        |
| B7    | 7      | $3.58 = 1.2^7$         | $1.94 = 1.1^7$        |

Table 0 B morf teNtneiciffE gnilacS :1to B7

- We multiply these scaling factors by the baseline EfficientNet-B0 values and round to the nearest integer to get the new depth, width, and resolution for each model.

# EfficientNet

---

- EfficientNet models achieve state-of-the-art accuracy with significantly fewer parameters and FLOPs.

# EfficientNet

---

- EfficientNet models achieve state-of-the-art accuracy with significantly fewer parameters and FLOPs.
- EfficientNet-B7 reaches 84.4% Top-1 and 97.3% Top-5 accuracy on ImageNet.

# EfficientNet

---

- EfficientNet models achieve state-of-the-art accuracy with significantly fewer parameters and FLOPs.
- EfficientNet-B7 reaches 84.4% Top-1 and 97.3% Top-5 accuracy on ImageNet.
- More efficient than previous CNN models 8.4—x smaller and 6.1x faster than competitors.

# EfficientNet Performance

Figure .tenegaml no ecnamrofreP teNtneiciffE :6

# Motivation for MobileNets

---

- **Why MobileNets?**

- Small-sized models are crucial for mobile and embedded devices.
- MobileNets reduce computational cost and memory usage while maintaining good accuracy.

- **Key Idea:**

- Use **depthwise-separable convolutions** to significantly reduce computation compared to standard convolutions.

# Computational Cost of Convolutions

---

- **Computational cost of standard convolution:**

Cost = # filter params  $\times$  # filter positions  $\times$  # filters

- Filters operate on all input channels, increasing computation significantly.

# Depthwise-Separable Convolutions

- Split standard convolution into two steps:
  - **Depthwise Convolution:** Applies a single filter per input channel.
  - **Pointwise Convolution:** Combines outputs from depthwise convolution.
- **Key Benefit:** Reduces computational cost significantly compared to standard convolution.

Normal Convolution

Depthwise Separable Convolution

# Depthwise Convolution

---

- Operates on each input channel separately.

# Pointwise Convolution

---

- Combines outputs from depthwise convolution using  $1 \times 1$  convolutions (mixes channels).

\*

=

Computational cost = #filter params x # filter positions x # of filters

# MobileNet Architectures

- **MobileNet v:2**

- Adds **residual connections**.
- Introduces:
  - **Expansion step:** Expands input dimensions before depthwise convolution.
  - **Projection step:** Reduces dimensions after processing.

MobileNet v1

MobileNet v2

# Pipeline Corrosion & Defect Analysis

---

- **CNN Architectures Used:**
  - ResNet
  - VGG
  - InceptionNet
- **Use Case:**
  - Automated analysis of pipeline conditions using camera feeds.
  - Classification of corrosion severity levels.
  - Predictive maintenance through visual pattern recognition.

# Pipeline Corrosion & Defect Analysis (cont.)

---

- **Benefits:**

- Reduces manual inspection costs and time.
- Early detection prevents catastrophic failures.
- Enables data-driven maintenance scheduling.

# Equipment Defect Classification

---

- **CNN Architectures Used:**
  - ResNet50 with Transfer Learning
  - VGG19
  - AlexNet
- **Use Case:**
  - Classify types of defects in steel surfaces and equipment.
  - Automated quality control for manufactured components.
  - Multi-class defect recognition (rust, cracks, deformation, etc.).

# Equipment Defect Classification (cont.)

- **Benefits:**
  - %99.4accuracy with transfer learning approaches.
  - Cost savings through early detection.
  - Replaces subjective manual inspections.

# Equipment Defect Classification (cont.)

# Oil Spill Detection & Classification

---

- **CNN Architectures Used:**
  - YOLOv4
  - Mask R-CNN
  - CNNs
- **Use Case:**
  - Classify oil spill severity and type from SAR/optical imagery.
  - Automated environmental monitoring systems.
  - Multi-class classification for response prioritization.

# Oil Spill Detection & Classification (cont.)

- **Benefits:**
  - Faster emergency response decisions.
  - Accurate spill characterization for cleanup planning.
  - Compliance with environmental regulations.
- **Research Papers & Resources:**
  - [Deep learning oil spill detector \(Sentinel-1 SAR, \(2022](#)
  - [Comprehensive review of oil spill DL methods\(2024\)](#)
